

**PATIENT PRESENTING CLINICAL SIGNS**

Moose Rangel History: Hx of Right hindlimb lameness and positive for Lyme's disease- under therapy. Arthroscopic revision of stifle WNLs 2 weeks ago.
Abnormal PE/Chem/CBC/UA Results:

SPECIES

Canine

COMPUTED TOMOGRAPHIC STUDY OF THE HIND LIMBS

A high resolution pre- and post-contrast CT study of the hind limbs is provided for review.

BREED

Labradoodle

COMPUTED TOMOGRAPHIC FINDINGS

The osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present smooth osseous margins and congruent joint spaces.

SEX

The volume of the right thigh musculature is mildly decreased.

Neutered Male

The right stifle joint presents a moderate to marked intracapsular soft tissue swelling. The osseous margins of both stifle joints are smooth.

AGE

2 Years

The osseous and surrounding soft tissue structures of both tarsal joints are within normal limits.

COMPUTED TOMOGRAPHIC DIAGNOSIS**INTERPRETED BY**

- Significant articular swelling right stifle joint
- Mild disuses atrophy right thigh musculature
- Normal coxofemoral joints
- Normal tarsal joints

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is evidence of moderate joint effusion of the right stifle joint which can be a sequela to the preceding arthroscopy. However, if there is persistent effusion rule out inflammatory causes (e.g., infectious versus immune mediated).

REFERRING VET

Dr. Meaux

A synovial tap can be used to check for inflammatory changes.

No additional abnormalities are appreciated, explaining the right hind limb lameness.
