PRESENTING CLINICAL SIGNS

- hyperthyroidism
- some mild weight loss
- radiographs taken in prep for radioiodine treatment at Radiocat

Abnormal PE/Chem/CBC/UA Results: mild weight loss

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

Along the thoracic spine, multifocal very mild spondylosis formation is seen.

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape; there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

Dorsal to the 2nd and 3rd sternebra, an ovoidal shaped soft tissue opacity is appreciated.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

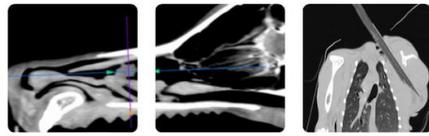

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

- Suspect mild lymphadenopathy sternal lymph node
- Spondylosis deformans

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The supposed prominent sternal lymph node can present reactive lymphoid hyperplasia -rule out abdominal pathology as well- or less likely here neoplastic transformation.
