

PATIENT

Carlos Lucke

PRESENTING CLINICAL SIGNS

Met check, confirmed abdominal mass waiting on ultrasound report for spleen vs liver to plan for surgery

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review.

BREED

Great Swiss Mtn Dog

RADIOGRAPHIC FINDINGS

Multifocal mild spondylosis formation is seen along the thoracic spine.

The extrathoracic soft tissues present homogeneous without abnormalities.

SEX

MN

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

AGE

10 Years

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

Mild bronchial mineralization is noted.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

HOSPITAL NAME

Boca Park Animal Hospital

RADIOGRAPHIC DIAGNOSIS

- Mild bronchial mineralization – likely due to age related changes versus hyperadrenocorticism.
- Spondylosis deformans

REFERRING VET

Laura Warren

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study is negative for pulmonary metastatic disease.
