

PATIENT PRESENTING CLINICAL SIGNS

Poppy Mateja Limping on left hind limb for about 2 weeks, was put on gabapentin 100mg once a day and complete rest. Owner says after going to the park she lifted her leg for about 10 minutes, but did not show any pain. Drawer test done, results negative

SPECIES RADIOGRAPHIC STUDY OF THE LEFT STILFE JOINT

Canine Radiographs of the left stifle joint in two orthogonal imaging planes and the right stifle joint in a craniocaudal projection are provided for review.

BREED RADIOGRAPHIC FINDINGS

Shetland Sheepdog The periarticular bones of the left stifle joint are smooth and there is no evidence of intracapsular soft tissue swelling. The patella of the left stifle joint is in situ.

SEX No abnormalities of the osseous and surrounding soft tissue structures of the right stifle joint are appreciated.

Spayed Female RADIOGRAPHIC DIAGNOSIS

- Normal left stifle joint

AGE

5 Years

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the left stifle joint presents without abnormalities, explaining the presenting clinical signs. Check clinically for evidence of patellar luxation. Rule out pain originating from the proximal or distal aspects of the left hind limb as source for the presenting clinical signs as well.
