Feline

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in two imaging planes are provided for review.

BREED

Toy Poodle

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

SF

The extrathoracic soft tissues present homogeneous without abnormalities.

The caudal contour of the cardiac silhouette is steep, and the caudal cardiac waist is lost. There is splaying of the main-stem bronchi in the lateral view. The pulmonary vasculature is within normal limits.

AGE

11 Years, Months

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

A mild increased visibility of the bronchial walls is appreciated.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

HOSPITAL NAME

DPC Veterinary
Hospital

RADIOGRAPHIC DIAGNOSIS

- Mild bronchial pattern
- Suspect left sided cardiomegaly without evidence of decompensation

REFERRING VET

Dr. Rivera

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic findings are suggestive for bronchitis. Primary inflammatory bronchitis (e.g. allergic, Lymphocytic plasmocytic, eosinophilic, mixed) and infectious bronchitis – viral, bacterial, parasitic – are considerations; I consider the odds for non-infectious origin higher.

INVOICE

51466

Check if cardiac murmur is present to rule in/out underlying cause for the suspected cardiomegaly – myxomatous mitral valve degeneration is most common.
