

PATIENT PRESENTING CLINICAL SIGNS

Zizou Bercian Here to check mouth - most likely a tooth root abscess Licking of the paws Lost weight - had diarrhea, old fed a bland diet, then resolved. Discharge from penis.

SPECIES RADIOGRAPHIC STUDY OF THE SKULL & THORAX

Canine Radiographs of the skull and thorax in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

BREED
Maltese

Skull
No side markers are present. In the DV projection, the left side of the image is considered as the left side of the patient and vice versa.

SEX
Male
All teeth but triadan 103, 104, 204, 309, 404 and 409 are absent. All teeth present a significant widening of the periodontal space. Triadan 309 is located in the region of the buccal soft tissues

Thorax

AGE
10 Years
The surrounding bony structures are within normal limits.

The extrathoracic soft tissues present homogeneous without abnormalities.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

HOSPITAL NAME

Animal Paradise
Hospital

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

REFERRING VET

Dr. Kristen Hellwarth

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

- Dislodged 309 from alveolar crest
- Generalized advanced periodontal disease of the remaining teeth
- Multiple absent teeth
- Normal thorax

DATE

4-12-22

PATIENT

Zizou Bercian

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The first molar of one mandible – suspect left – is dislodged from the alveolar crest and appears to be located in the associated soft tissues. Recommend complete evaluation of the oral cavity and dental workup.
