

PATIENT PRESENTING CLINICAL SIGNS

Ginger Connors Pet had presented last month for routine exam last month when a soft tissue swelling was noted at his right hock. FNA/Cytology at that time was concerning for a round cell tumor (probable plasma cell tumor). Thoracic x-rays submitted as part of staging prior to owner considering further treatment. An abdominal ultrasound was also performed today by Sonopath (results pending)

SPECIES

Feline

Abnormal PE/Chem/CBC/UA Results: CBC: WBC = 21.9 (Neuts = 18,440; Monos = 1402) Chem: Amylase = 2316 Na+ = 159

RADIOGRAPHIC STUDY OF THE THORAX

BREED

Radiographs of the thorax in three imaging planes are provided for review.

DSH

RADIOGRAPHIC FINDINGS

The body condition score is 9/9.

SEX

Male Neutered

The periarticular bones of the left shoulder joint present advanced osteophyte new bone formation. The right elbow joint presents mild osteophyte new bone formation.

AGE

14 Years, 7 Months

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The mediastinum is significantly widened by fat.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

HOSPITAL NAME

Long Valley Animal
Hospital

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

REFERRING VET

Russell Earl

- Obesity
- Degenerative osteoarthritis left shoulder joint
- Degenerative osteoarthritis right elbow joint

INVOICE

57798

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the thorax is negative for pulmonary metastatic disease.
