

## PATIENT

Lola Hunt

## SPECIES

Canine

## BREED

Boxer Mix

## SEX

SF

## AGE

5.5Y

## WEIGHT

64lbs

## INTERPRETED BY

Sebastian Schaub, DVM  
Dr. med. vet.  
DipECVDI

## IMAGING PERFORMED BY

Jen Amidon

## HOSPITAL NAME

The Pet Hospital of  
Stratford

## REFERRING VET

Dr. Robert Bashkin

## INVOICE

74638

## DATE

4-16-26

## PRESENTING CLINICAL SIGNS

Hx of fractured digit 4 P2. Pt has been splinted for 4 weeks.

## RADIOGRAPHIC STUDY OF THE RIGHT HIND PAW

Radiographs of the right hind paw in two orthogonal image planes are provided for review.

## RADIOGRAPHIC FINDINGS

The diaphysis of the middle phalanx of the fourth digit presents an oblique ill-defined, fracture line, running in a laterodistal to medioproximal direction. Mild mineralized callus formation is appreciated along the diaphysis of the middle phalanx. The distal segment of the middle phalanx of the 4<sup>th</sup> digit is moderately displaced axially and proximally. The 4<sup>th</sup> digit presents a moderate circumferential soft tissue swelling.

The remainder of the osseous and soft tissue structures of the right hind paw reveal no abnormalities.

## RADIOGRAPHIC DIAGNOSIS

- Chronic traumatic long oblique diaphyseal fracture middle phalanx 4<sup>th</sup> digit right hind paw – in reparation phase
- Secondary moderate soft tissue swelling 4<sup>th</sup> digit right hind paw

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The fracture of the middle phalanx of the 4rh digit of the right hind paw is in the reparation phase and is likely to be stable – I suspect predominant non-mineralized fibrous callus formation to be present.
