PRESENTING CLINICAL SIGNS

Eevee is a 6yo SF presenting for Chronic intermittent diarrhea and vomiting, most recently since Saturday with acute onset of both symptoms. Whimpering and visible signs of abdominal pain such as downward dog actions reported. Hard stool noted today following administration of an unknown pill provided by a neighbor on Saturday. Diet recently changed to Hill's Science Diet Adult Chicken & Barley following last episode, with good acceptance and initial improvement. History of consuming bully bones and chew bones, with possible inadequate chewing.

Abnormal PE/Chem/CBC/UA Results: Abd/GI: Palpates soft and with no organomegaly, masses, or pain noted. V/D: Addison's vs sensitive stomach and P getting treats and things upsetting the stomach/dietary indiscretion vs FB/obstruction vs other metabolic vs infectious (parasitic (neg Fecal Dx Profile w/Giardia 2 months ago) vs bacterial vs viral vs open) vs open.

RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the abdomen in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Normal abdomen

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no abnormalities and an underlying cause for the chronic vomiting cannot be specified. There is no evidence of radiopaque foreign material, abnormal gas pattern or signs for gastrointestinal mechanical obstruction. Rule out gastritis, parasitic infection, dietary indiscretion, pancreatitis, other. Complementing workup by an abdominal ultrasound examination may be beneficial.
