

PATIENT

Petey Holmes

PRESENTING CLINICAL SIGNS

Chronic cough

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in two imaging planes are provided for review.

BREED

Toy Poodle

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

SEX

Male N

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

AGE

5-25-2006

Mild increased visibility of the bronchial walls is appreciated as well as a mild generalized increased radiopacity of the lung parenchyma, caused by an unstructured reticular pattern.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Mild broncho-interstitial pattern

HOSPITAL NAME

Cottage Grove
Veterinary Clinic

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The mild broncho-interstitial lung pattern can be a sequela to age related changes of the lung parenchyma/bronchial walls. However, accompanying inflammatory lower airway disease appears likely and non-infectious origin is considered as the top differential (e.g. eosinophilic, lymphocytic plasmocytic, neutrophilic, mixed). There are no signs for pneumonia or fulminant bronchitis.
