

**PATIENT PRESENTING CLINICAL SIGNS**

Max Schild Lesion inside left nostril.

COMPUTED TOMOGRAPHY OF THE SKULL**SPECIES** A high resolution pre- and post-contrast CT study of the skull is provided for review.Canine **COMPUTED TOMOGRAPHIC FINDINGS**

The tooth elements 308 & 408 are absent.

BREED The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining.

Wheaten Terrier Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

SEX Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

Neutered Male

AGE The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

5 Years The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

INTERPRETED BY COMPUTED TOMOGRAPHIC DIAGNOSISSebastian Schaub, DVM
Dr. med. vet. DipECVDI

- Absent triadan 308 & 408
- Normal upper airways

HOSPITAL NAME

Mobile Pet Imaging

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT study of the skull presents without clinically relevant abnormalities. There is no evidence of a mass associated with the upper airways. Regarding the history, rhinoscopy including biopsy of a discoloration of the left nasal opening has already been performed.
