## PRESENTING CLINICAL SIGNS

Referral, presents for CT of shoulders and elbows due to persistent RIGHT forelimb lameness.

- Chronic, intermittent right front limb lameness; worsens off carprofen, intermittent improvement with rest (confirmed with Os they thought lameness was on RF)

- Limping noted daily; exacerbated post-exercise, improves with warm-up

- Previous radiographs (right front limb), results unclear

- Walks 2-4 miles daily

- Overweight (BCS 7/9)

- Probiotic administered; history of chronic diarrhea as a puppy, resolved

- Enzymatic ear cleaner (hydrocortisone 1%) used for presumed otitis externa, ongoing for 1 week

- Eating and drinking well

- No vomiting, diarrhea, coughing, or sneezing reported

Current medications:

- Carprofen 100 mg, 1.5 tabs PO q12h PRN for lameness; last administered 2 days ago

- Enzymatic ear cleaner (hydrocortisone 1%) for otitis externa

Abnormal PE/Chem/CBC/UA Results: Overweight (BCS 7/9), Lameness on left front limb at fast walk/trot (not RF as reported by Os)

## COMPUTED TOMOGRAPHY OF THE SHOULDER & ELBOW JOINTS

A high resolution plain CT study of the shoulder & elbow joints is provided for review.

## COMPUTED TOMOGRAPHIC FINDINGS

Both shoulder joints present smooth margins of the periarticular bones and the surrounding soft tissue structures are within normal limits.

The periarticular bones of the right elbow joint present mild osteophyte new bone formation. The medial coronoid process of the right elbow joints mildly irregular and has a mild heterogeneous density. The surrounding soft tissue structures of the elbow joints are within normal limits.

## COMPUTED TOMOGRAPHIC DIAGNOSIS

- Coronoid disease right elbow joint
- Mild degenerative osteoarthritis right elbow joint
- Normal left elbow joint
- Normal shoulder joints

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT findings are indicative for elbow dysplasia of the right elbow joint and secondary mild degenerative joint disease. Arthroscopy/arthrotomy would be ideal to revise the elbow joint and remove the osseous fragment/nonvital tip of the medial coronoid process. No abnormalities of the left elbow joint are appreciated.
