

PATIENT PRESENTING CLINICAL SIGNS

Mowgli Kutz History: Stiff gait, walks camped out, muscle atrophy. Painful on manipulation of hips.
Abnormal PE/Chem/CBC/UA Results:

SPECIES RADIOGRAPHIC STUDY OF THE LUMBAR SPINE, PELVIS AND HIND LIMBS

Canine A complete set of radiographs of the lumbar spine, pelvis and the hind limbs is provided for review.

RADIOGRAPHIC FINDINGS

BREED

Great Pyrenees X The growth plates are age related visible.
The osseous and surrounding soft tissue structures of the lumbar spine present no abnormalities.

SEX

Male The volume of the soft tissue shadow of the musculature of the left hind limb is moderately decreased.
The osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present a widening of the joint space and the center of the femoral heads is lateral to the dorsal acetabular rim.

AGE

7 Month The left & right stifle joint presents smooth osseous margins and without signs of intracapsular swelling.
The osseous and surrounding soft tissue structures of both tarsal joints are within normal limits.

INTERPRETED BY RADIOGRAPHIC DIAGNOSIS

Sebastian Schaub, DVM Dr. med. vet. DipECVDI

- Bilateral hip dysplasia
- Normal lumbar spine
- Normal stifle joints
- Normal tarsal joints

HOSPITAL NAME INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Sunridge VC The changes of the coxofemoral joints are consistent with increased laxity of the coxofemoral joints due to hip dysplasia. Theoretically, widening of the joint space of the coxofemoral joints can be caused by joint effusion as well, but is considered less likely as autoimmune mediated arthritis would be considered likely and would be commonly associated with swelling of the distal joints of the limbs as well – a synovial tap of the coxofemoral joints might be used to rule out underlying arthritis entirely.
