RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the abdomen in two imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

AGE

4 Years, 3 Months

The vertebral endplates L2/L3 present moderate spondylosis formation.

INTERPRETED BY

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

HOSPITAL NAME

DPC Veterinary
 Hospital

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

REFERRING VET

Dr. Rivera

The stomach is in its anticipated position and is empty.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

INVOICE

51319

The colon is seen in the expected position and contains a mild amount of gas. The colon presents with mild hyperperistalsis.

DATE

4-3-22

RADIOGRAPHIC DIAGNOSIS

- Empty gastrointestinal tract
- Suspect hypermotility of the colon
- Spondylosis deformans
