

**PATIENT**

Luna Radan

PRESENTING CLINICAL SIGNS

Sudden onset of lameness since yesterday on right hindlimb
Abnormal PE/Chem/CBC/UA Results: Bloodwork unremarkable

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE STIFLE JOINTS

Radiographs of both stifle joints in two imaging planes are provided for review.

BREED

Yorkshire Terrier

RADIOGRAPHIC FINDINGS

No physical side markers are present.

The growth plates are age related open.

SEX

Female

The apophysis of the right tibial tuberosity appears widened and the tibial tuberosity appears to be in a mildly more proximal position.

The mediolateral projection of the left stifle joint is moderately rotated, limiting the diagnostic value for comparison.

AGE

20 Weeks

RADIOGRAPHIC DIAGNOSIS

- Suspect right sided avulsion fracture of the right tibial tuberosity

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The diagnosis of the avulsion fracture of the right tibial tuberosity is not definitive, as the left tibial tuberosity presents with a prominent growth plate as well – but the radiograph is moderately rotated. Recommend well-positioned follow up radiographs of both stifle joints to rule in/out the diagnosis.
