

PATIENT PRESENTING CLINICAL SIGNS

Holly Mytnowych Limping on LFL for 12 days
Abnormal PE/Chem/CBC/UA Results: non-weight bearing on LFL, small blueberry sized non freely movable mass can be palpated on the medial aspect of distal -left humerus, cat reactive when the mass is touched, BUN, creatinine both moderately elevated

SPECIES

Feline

RADIOGRAPHIC STUDY OF THE ELBOW JOINTS

Radiographs of the left elbow joint in two orthogonal imaging planes are provided for review.

BREED

RADIOGRAPHIC FINDINGS

Domestic Longhair At the caudal cortex of the distal third of the diaphysis of the left humerus presents a zone with immature periosteal new bone formation. A homogeneous mild soft tissue swelling is seen at the medioproximal aspect of the supracondylar foramen of the left humerus.

SEX

The left elbow joint presents without abnormalities of the osseous and surrounding soft tissue structures.

Female Spayed

RADIOGRAPHIC DIAGNOSIS

AGE

16 Years

- Aggressive osteoproliferative lesion caudal cortex distal segment left humerus with associated soft tissue swelling
- Normal left elbow joint

INTERPRETED BY

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The clinically appreciated mass presents evidence of being in contact with the periosteum of the left humerus and soft tissue neoplasia (e.g. fibrosarcoma, rhabdomyosarcoma) or periosteal osteosarcoma are considerations. FNA sampling can be performed for further definition.
