

PATIENT PRESENTING CLINICAL SIGNS

Jinx Shapiro History: Acute onset of lameness LF limb. Intermittently weight bearing. Suspected jump from a height and painful on left elbow extension and flexion.
Abnormal PE/Chem/CBC/UA Results:

SPECIES RADIOGRAPHIC STUDY OF THE ELBOW JOINTS

Feline Radiographs of the elbow joints in two orthogonal imaging planes are provided for review.

BREED RADIOGRAPHIC FINDINGS

DSH A small osseous spur is seen at the left medial humeral epicondyle. The remainder of the osseous and soft tissue structures of both elbow joints are smooth and unremarkable.

SEX RADIOGRAPHIC DIAGNOSIS

Spayed Female

- Small enthesophyte left medial humeral epicondyle

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

AGE
10 Years The radiographic study presents no specific abnormality, explaining the left front limb lameness. The enthesophyte is considered as an incidental finding – no signs of medial humeral epicondylitis. Contusion or distortion is a potential here. Consider a clinical trial with NSAID.
