

PATIENT PRESENTING CLINICAL SIGNS

Kali Garcia Cali presents today for diarrhea Medical Hx: Diarrhea present for about 1 week. Started having hematochezia this morning. Seen at LAASER on 04/02/23 for vomiting. O declined recommended diagnostics (CBC and radiographs), electing for outpatient care. SQF and cerenia injection administered. Possible dietary indiscretion. No known foreign body ingestion. No travel, no ticks, no known toxins, no trauma. EDUD normal for the most part. Reluctant to eat last night C/S: None V/D: no more vomiting Drinking less over the last week Energy is normal, no concerns Current diet: Bland diet as recommended by ER. O started reintroducing normal kibble yesterday. O does not recall brand

SPECIES BREED RADIOGRAPHIC STUDY OF THE ABDOMEN

K9 Chihuahua Radiographs of the abdomen in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

SEX The surrounding bony structures are within normal limits.
Female Spayed No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin. Thin mineral opaque loops of suture material are seen at the mid ventral abdominal wall.

AGE The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

6 Years The liver is appropriate in position, size and presents uniform opacity.

INTERPRETED BY

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

Only the left kidney can be delineated and presents with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

HOSPITAL NAME

The stomach is in its anticipated position and is empty.

DTLAvets

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position, empty and collapsed.

REFERRING VET

RADIOGRAPHIC DIAGNOSIS

Dr. Montoya

- Empty gastrointestinal tract
- Right kidney not visible

INVOICE

57680

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The overall empty gastrointestinal tract – including the colon – in combination with the presenting clinical signs is supporting the diagnosis of possible gastroenteritis – e.g. due to dietary indiscretion, parasitic infection, dysbacteriosis, pancreatitis. There is no evidence of radiopaque foreign material, abnormal gas pattern or signs for gastrointestinal mechanical obstruction. If not done so yet, recommend complementing workup by complete blood work.

DATE

4-6-23

The non-visible right kidney can be a sequela to superimposition and border effacement (most likely), potentials include renal hypoplasia, renal dysplasia, chronic nephritis.
