

PATIENT

McGee O'Connor

PRESENTING CLINICAL SIGNS

Presented for 2 week history of lethargy, inappetence, difficulty walking. Acute onset back pain and shortened stride 48hrs. Multiple valley fever tests negative, bwk unremarkable other than severe neutrophilia. Responsive to steroid treatment and abx. 4DX negative, xrays normal.

SPECIES

Canine

COMPUTED TOMOGRAPHY OF THE ENTIRE SPINE

A high resolution pre- and post-contrast CT study of the cervical, thoracic and lumbar spine are provided for review.

BREED

Labradoodle

COMPUTED TOMOGRAPHIC FINDINGS

The osseous and soft tissue structures of the cervical-, thoracic- and lumbar spine are within normal limits. The dural tube presents an even diameter throughout.

SEX

Male

The axillary lymph nodes bilaterally are prominent.

AGE

5 Months

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Lymphadenopathy axillary lymph nodes
- Structural normal cervical, thoracic and lumbar spine

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The current CT study of the entire spine presents without abnormalities. If not done so yet, recommend complementing workup by a CSF tap including testing for IgA levels to rule in/out underlying steroid responsive meningitis arteritis as underlying cause for the clinical signs.

Reactive hyperplasia of the axillary lymph nodes is likely which can be an age related finding. Consider FNA sampling as advanced diagnostic test.
