PRESENTING CLINICAL SIGNS

Purple discoloration to 104, 204, 304 noticed during neuter. CT performed to check vitality of teeth to help determine necessary next steps needed.

COMPUTED TOMOGRAPHY OF THE SKULL

A high resolution plain CT study of the viscerocranium is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

The pictured parts of the dentition are complete and unremarkable in all jaw quadrants. Even narrowing of the pulp cavity of the canine teeth is appreciated.

The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Normal dentition

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT study of the dental arcade presents without abnormalities. There is even narrowing of the pulp cavity of the canine teeth, and I would consider the teeth to be vital – in teeth becoming non vital early in live, the pulp cavity will remain stationary widened.
