PRESENTING CLINICAL SIGNS

Intermittent lameness right hind
Abnormal PE/Chem/CBC/UA Results:

RADIOGRAPHIC STUDY OF THE PELVIS AND RIGHT STIFLE JOINT

Radiographs of the pelvis & right stifle joints in two orthogonal imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

The osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present mild incongruity of the joint spaces. The subchondral bone of the craniolateral acetabular rim of the left coxofemoral joint presents a moderate lateral widening of the sclerosis of the subchondral bone.

The right stifle joint presents smooth osseous margins and without evidence of intracapsular soft tissue swelling.

RADIOGRAPHIC DIAGNOSIS

- Mild hip dysplasia – likely clinically not relevant
- Normal right stifle joint

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the pelvis and the right stifle joint presents without abnormalities explaining the intermittent right hind limb lameness. Check clinically for signs of patellar luxation as source for intermittent lameness.
