PRESENTING CLINICAL SIGNS

History: Pt has a history of severe degenerative joint disease in both elbows. This was confirmed via first CT on 1/23/25. Recently limping/soreness has increased, can't do as much activity as previous. Reimaging to evaluate for any fragments that could be removed via arthroscopy.

Abnormal PE/Chem/CBC/UA Results: Hx of severe DJD in elbows Mild to moderate increase in ALP, labwork otherwise WNL

COMPUTED TOMOGRAPHIC STUDY OF THE ELBOW JOINTS

A high-resolution plain CT study of the elbow joints is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

The periarticular bones of both elbow joints present moderate osteophyte new bone formation. The medial coronoid process of both elbow joints is irregular and has a heterogeneous density. Along the lateral surface of the medial coronoid process of the right elbow joint, multiple isolated mineral attenuating bodies are seen. Both elbow joints present an incongruent joint space, due to radio-ulnar step formation.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Advanced osteoarthritis elbow joint bilaterally
- Coronoid disease elbow joint bilaterally with small isolated osseous fragments along the medial coronoid process of the right elbow joint.
- Incongruity elbow joint bilaterally

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT study is fitting the history of degenerative joint disease of both elbow joints, isolated osseous fragments are appreciated along the lateral aspect of the medial coronoid process of the right elbow joint.

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology
