

**PATIENT**

Rowdy Gosselin

PRESENTING CLINICAL SIGNS

2 days prior played with couple other dogs without apparent issue, yesterday AM, small amount of limp through day, then today mostly mostly nonweight bearing all day since getting up this AM. Vocalizes when limb is fully extended cranially at home. Described as a drama queen.

SPECIES

Canine

Abnormal PE/Chem/CBC/UA Results: Largely nonweight bearing at exam. Uses it when she wants to. No soft tissue swellings palpated phalanges to scapula. No sensitivitie sexpressed to flexion nor extentions of RF phalanges to scapula. Nothing found in paw pads.

BREED

Golden Doodle

Radiographs of the right elbow joint in two imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

The growth plates are age related visible.

SEX

Female

The right elbow joint presents smooth osseous margins. The contour of the medial coronoid process of the right elbow joint is well defined, unremarkable. No abnormalities of the surrounding soft tissue structures of the right elbow joint are appreciated.

RADIOGRAPHIC DIAGNOSIS

- Normal right elbow joint

AGE

9 Months

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the right front limb presents without abnormalities, explaining the clinical signs. Consider a clinical trial with NSAID and rest and reevaluating the patient if clinical signs are refractory to therapy.
