

PATIENT PRESENTING CLINICAL SIGNS

Red Donohue History of allergies and sneezing. Most recently constant sneezing, non-stop, producing blood from nares.
Abnormal PE/Chem/CBC/UA Results: WNL

SPECIES COMPUTED TOMOGRAPHY OF THE SKULL

Feline A high resolution pre- and post-contrast CT study of the skull is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

BREED The roots of the canine teeth present with ankylosis and resorptive lesions.

DSH The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining. The nasopharyngeal tonsils are mildly prominent.

SEX Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

FS Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

AGE The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.
10

INTERPRETED BY The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Mild prominent nasopharyngeal tonsils
- Ankylosis and tooth root resorption canine teeth

HOSPITAL NAME

Catskill Veterinary
Services, PLLC

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT study presents without specific abnormalities of the upper airways, explaining the sneezing & epistaxis. Possible allergic rhinitis or early stage of viral rhinitis might be a consideration. The mild enlargement of the nasopharyngeal tonsils can present secondary reactive hyperplasia.
