## IMAGING PERFORMED BY

Ali

## HOSPITAL NAME

Green Dog Dental and  
Wellness

## REFERRING VET

Celestine Hoh

## INVOICE

75096

## DATE

5-21-26

## PRESENTING CLINICAL SIGNS

Presenting Complaint: Anita presents for recheck due to persistent coughing and sneezing

Patient History:

Dispensed Tamaril-P on April 30th, 2026

Coughing relapsed after Tamaril-P was discontinued

Coughed and sneezed frequently Friday and Saturday, improved Sunday and today (Monday)

Appetite remains normal

## RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review.

## RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape; there is no evidence of cardiac chamber or vascular enlargement.

The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

## RADIOGRAPHIC DIAGNOSIS

- Normal thorax

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no abnormalities. However, a negative radiographic study does not rule out possible underlying tracheitis/bronchitis.
