

## PATIENT

Littles Hoffman

## SPECIES

Feline

## BREED

DSH

## SEX

Spayed Female

## AGE

3 Years

## WEIGHT

14.8

## INTERPRETED BY

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

## IMAGING PERFORMED BY

Dr. Harlec/Danielle  
Cintron

## HOSPITAL NAME

Newburgh VH

## REFERRING VET

Dr. Harlec

## INVOICE

37201

## DATE

5/21/26

## PRESENTING CLINICAL SIGNS

History: Intermittent limping on left front for last 6months, sometimes holding paw up when sitting. Started after jumping over baby gate while owner was away- was more pronounced at that time but is still intermittent.

## COMPUTED TOMOGRAPHIC STUDY OF THE SHOULDER & ELBOW JOINTS

A high resolution pre- and post-contrast CT study of the front limbs is provided for review.

## COMPUTED TOMOGRAPHIC FINDINGS

Both shoulder joints present smooth margins of the periarticular bones and the surrounding soft tissue structures are within normal limits.

The periarticular bones of both elbow joints present mild osteophyte new bone formation, L>R. At the caudal aspect of the medial humeral epicondyle, mild new bone formation is seen. Along the joint capsule of both elbow joints mild punctuate mineralization is seen.

## COMPUTED TOMOGRAPHIC DIAGNOSIS

- Mild osteoarthritis elbow joint bilaterally
- Mild metaplasia along the joint capsule of both elbow joints
- Mild medial humeral epicondylitis
- Normal shoulder joints

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT study reveals mild degenerative joint disease of both elbow joints that may serve as a trigger for the intermittent front limb lameness. No additional abnormalities are appreciated that do explain the front limb lameness.
