

PATIENT

Midnight, Shelby
Moriarty

SPECIES

Feline

BREED

Domestic Short Hair

SEX

Female Spayed

AGE

10.5Y

WEIGHT

4.4lbs

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet.
DipECVDI

IMAGING PERFORMED BY

Dr. Abina Glennon

HOSPITAL NAME

New Bridge Veterinary
Practice

REFERRING VET

Dr. Abina Glennon

INVOICE

75212

DATE

5-28-26

PRESENTING CLINICAL SIGNS

Chronic diarrhea and anal gland issues for years
Weight loss

RADIOGRAPHIC STUDY OF THE ABDOMEN

A right lateral view of the abdomen is provided for review.

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

The ventral abdominal wall is tucked up.

The serosal detail is decreased, due to the lack of peritoneal fat – the margins of the abdominal organs are partially effaced.

The liver is appropriate in position, size and presents uniform opacity.

No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and is mildly distended by gas.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Lean body condition

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no abnormalities, but the decreased body condition score – an underlying cause for the chronic gastrointestinal clinical signs cannot be specified. Complementing workup by an abdominal ultrasound examination is beneficial to screen for intramural changes that are missed by radiography.
