

PATIENT

Bullet Gladue

PRESENTING CLINICAL SIGNS

coughing over the last year, getting worse

RADIOGRAPHIC STUDY OF THE THORAX

SPECIES

Feline

Radiographs of the thorax in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

Mild spondylosis formation is seen along the thoracolumbar junction

BREED

DSH

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

SEX

FS

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

AGE

15 Years

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Normal thorax but mild spondylosis deformans

HOSPITAL NAME

Sylvan Lake
Veterinary Clinic

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the thorax presents without significant changes but an equivocal subjective increased visibility of the bronchial wall. In combination with the presenting clinical signs, inflammatory lower airway disease is considered most likely.
