

**PATIENT**

Comet Mrozinski

**PRESENTING CLINICAL SIGNS**

P has a hx of intermittent R forelimb lameness after exercise. P is reactive on R elbow extension. P is intended as a hunting dog so elbow dysplasia possibility is concerning  
Abnormal PE/Chem/CBC/UA Results: Pain on R elbow extension. No lameness noted during exam however

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE RIGHT ELBOW JOINT**

Radiographs of the right elbow joint in two imaging planes are provided for review.

**BREED**

Cocker Spaniel

**RADIOGRAPHIC FINDINGS**

The right elbow joint presents smooth osseous margins, and the contour of the medial coronoid process is sharply delineated and presents a homogeneous density. No abnormalities of the surrounding soft tissue structures are noted.

**SEX**

M

**RADIOGRAPHIC DIAGNOSIS**

- Normal right elbow joint

**AGE**

20 Months

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic study of the right elbow joint presents without abnormalities, if there is strong suspicion for pathology of the elbow joint a CT study can be used as advanced imaging modality.

**INTERPRETED BY**

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

Check the right front paw for source of pain as well, as there is malformation and foreshortening of the fifth metacarpal bone and misshapen metacarpophalangeal joint which can be a source for pain.
