

PATIENT PRESENTING CLINICAL SIGNS

Fiona Little History: She has been vomiting. As far as Hope knows, the vomiting started today. Today she vomited 6 times, mainly white foam. She is eating, but it is decreased and she is mainly eating the wet food. She is an indoor/outdoor cat. 2 nights ago, she tried to lure her in the house with some treats, and she refused and preferred to eat grass which is highly unusual for her.

SPECIES

RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the abdomen in three imaging planes are provided for review.

BREED

DSH

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

Spayed Female

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

AGE

1 Years 6 Months

The splenic head is in the anticipated position and within normal limits for size and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

HOSPITAL NAME

Elizabeth AH

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Normal abdomen

REFERRING VET

Leon Anderson, DVM

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study presents no abnormalities explaining the recent onset of vomiting. There is no evidence of radiopaque foreign material, abnormal gas pattern or signs for gastrointestinal mechanical obstruction. If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination; in some cases, a high ileus may lack classical radiographic signs of mechanical obstruction.
