RADIOGRAPHIC STUDY OF THE NECK AND THORAX

Radiographs of the neck and thorax in three imaging planes are provided for review.

BREED

Yorkie

RADIOGRAPHIC FINDINGS

In the lateral projections of the neck, the pinna of one ear is superimposed on the larynx. No abnormalities of the osseous and soft tissue structures of the neck are appreciated.

SEX

The surrounding bony structures are within normal limits.

MN

The extrathoracic soft tissues present homogeneous without abnormalities.

AGE

12

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

HOSPITAL NAME

CJAH

The lung parenchyma presents a generalized mild to moderate unstructured reticular pattern, blurring the peripheral lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

REFERRING VET

Gabriel

RADIOGRAPHIC DIAGNOSIS

- Generalized moderate unstructured interstitial lung pattern
- Normal neck

INVOICE

51952

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The unstructured interstitial lung pattern can be accentuated by age related changes of the lung parenchyma. As the lung pattern is not specific, potentials include fibrosis, pneumonitis (inflammatory versus infectious), systemic disease (e.g. pancreatitis, IMHA, renal disease), neoplasia.
