

PATIENT

Minka Gaudet

PRESENTING CLINICAL SIGNS

Minka is a 15 month old female spayed Russian Blue that was presented for 4 episodes of vomiting and inappetence initially 4 days ago. She has been rehydrated with SQ fluid and was sent home on appetite stimulators. She came back 2 days ago with the same clinical signs of vomiting and inappetence. Abdominal radiographs were performed and she was sent home on injection of Maropitant and metronidazole. She came back today with inappetence and the owner reported they did not notice any episode of vomiting since the maropitant injection.

RADIOGRAPHIC STUDY OF THE ABDOMEN

BREED

Russian Blue

Radiographs of the abdomen in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

Spayed Female

A wet fur artefact is noted along the ventral abdominal wall. No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

AGE

15 Months

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and presents normal content.

HOSPITAL NAME

Beaches-Fallingbrook
Veterinary Clinic

The small intestinal loops are of even diameter and non-dilated, a moderate amount of gas is seen throughout the small intestinal loops

The colon is seen in the expected position and contains a mild amount of foamy fecal material.

RADIOGRAPHIC DIAGNOSIS

REFERRING VET

Dr Matt Haghightat

- Foamy gas pattern throughout the small intestinal loops

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The foamy pattern throughout the small intestinal loops can indicate enteritis. There is no evidence of radiopaque foreign material or signs for gastrointestinal mechanical obstruction. If clinical signs are refractory to empirical therapy, recommend follow up radiographs or a complete abdominal ultrasound examination; in some cases, a high ileus may lack classical radiographic signs of mechanical obstruction.
