

PATIENT PRESENTING CLINICAL SIGNS

Stella Abdul-Chani Lameness L pelvic limb with swelling over distal radius. Medications, Gabapentin 600mg BID, Carprofen 150MG BID

SPECIES RADIOGRAPHIC STUDY OF THE LEFT CARPAL JOINT

Canine Radiographs of the left carpal joint in two orthogonal imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

BREED

Great Dane The right distal metaphysis and distal segment of the diaphysis presents an ill-defined zone with permeative osteolysis and immature periosteal new bone formation cranially and medially. A soft tissue swelling is appreciated level with the distal segment of the radius – accentuated dorsally and medially.

Multiple irregular mineralization are seen along the lateral aspect of the left carpal joint.

SEX RADIOGRAPHIC DIAGNOSIS

FS

- Monostotic aggressive osteolytic lesion left distal radius with accompanying soft tissue swelling
- Suspect dystrophic mineralization lateral collateral ligament left carpal joint

AGE

6 Years

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INTERPRETED BY

The aggressive bone lesion of the left distal radius is consistent with primary osseous neoplasia and osteosarcoma is the most likely entity. FNA sampling or biopsy can be performed to confirm the diagnosis.
