RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review. Images are provided in BMP file format.

BREED

Lab

RADIOGRAPHIC FINDINGS

The body condition score is 9/9.

SEX

MN

Multifocal mild spondylosis formation is seen along the thoracic spine. Mild osteophyte formation can be appreciated at the caudal aspect of the humeral heads bilaterally.

The extrathoracic soft tissues present homogeneous without abnormalities.

AGE

4

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents a generalized mild to moderate ground glass opacification – due to nutritional status. Multifocal throughout the lung parenchyma, randomly distributed pinpoint mineralization of the lung parenchyma is noted. The intrapulmonary vascular branching is seen up to the third order lung vessels.

HOSPITAL NAME

Torch Lake
Veterinary Clinic

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

REFERRING VET

Adrienne Waffle

- Mild degenerative osteoarthritis shoulder joints bilaterally
- Pulmonary osteomas
- Spondylosis deformans
