

PATIENT PRESENTING CLINICAL SIGNS

Dream Carson
Reason for Visit: CHECK LUMP History: P IS A 10Y8M OLD F/S PRESA CANARIO PRESENTING TODAY FOR CHECK LUMP ON BELLY. O NOTICED HARD LUMP ON L SIDE OF ABDOMEN CAUDAL TO RIB CAGE. O STATES P VERY ANXIETY GETTING WORSE P HAS STORM PHOBIAS MEDS DISPENSED IN PAST DID NOT HELP.

SPECIES
Canine
Abnormal PE/Chem/CBC/UA Results: Hydration: Adequate Mentation: BAR EENT: OU clear. AU clear, no debris. No cough on tracheal palpation. Oral cavity: No dental tartar. Lymph Nodes: submandibular, prescapular and popliteal lymph nodes normal size, shape and consistency Skin: Firm mammary mass ~1.5cmx1cmx0.5cm right fourth mammary gland. CV/Respiratory: Normal heart rate and rhythm, no murmur, pulses strong and synchronous, normal bronchovesicular sounds. Abd/GI: Soft, non-painful, no fluid wave, no palpable masses or organomegaly.

BREED
Presa Canario
Uro/Perineum: No lesions or abnormalities. Musculoskeletal: BCS = 5/9. Ambulatory x 4, normal gait, normal palpation all 4 limbs. Neurological: Alert and appropriate. No deficits noted.

SEX
SF
Diagnostic Testing Needed: Thoracic radiographs 3-view--unable to obtain due to patient temperament Discussed mammary tumors in general--statistically, 50% chance of malignancy and of those masses that are malignant, 50% will have metastatic disease at time of diagnosis. FNA is not a consistently useful diagnostic test for mammary masses since false negatives occur often duet o mixed nature of mammary tumors. While mass is small, recommend local excision/solitary mastectomy and histopathology.

AGE RADIOGRAPHIC STUDY OF THE THORAX

10 Years, 6 Months
A consecutive radiographic study of the thorax is provided for review. Radiographs are dated 6/11/22 and 6/14/22.

INTERPRETED BY RADIOGRAPHIC FINDINGS

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI
6/11/22

The body condition score is 8/9.

HOSPITAL NAME
The periarticular bones of both elbow joints present moderate osteophyte new bone formation.

DPC Veterinary Hospital
The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

REFERRING VET
The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

Dr. Rivera
The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INVOICE
52448
The lung parenchyma presents a generalized mild to moderate unstructured reticular pattern, blurring the peripheral lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

DATE
6/14/22

6-14-22
The follow up radiographic study of the thorax presents with the same findings like the preceding radiographic study.

PATIENT

Dream Carson

RADIOGRAPHIC DIAGNOSIS

- Obesity
- Moderate unstructured interstitial lung pattern
- Degenerative osteoarthritis elbow joints bilaterally
- No evidence of pulmonary metastatic disease

SPECIES

Canine

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The unstructured interstitial lung pattern is likely a sequela to the nutritional status and age related changes of the lung parenchyma. The odds for 'real' interstitial lung pattern are considered low –potentials would include fibrosis, pneumonitis (inflammatory versus infectious), systemic disease (e.g. pancreatitis, IMHA, renal disease), neoplasia.
