

PATIENT PRESENTING CLINICAL SIGNS

Puzzle Hodges CT to evaluate ongoing sneezing and nasal discharge that has been intermittent over the last 2 years but more persistent in the last few months.

SPECIES COMPUTED TOMOGRAPHY OF THE SKULL

Canine A high resolution pre- and post-contrast CT study of the splanchnocranium is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

BREED The tooth element 205 is absent.

Belgian Sheepdog The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining.

SEX Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

Female Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

AGE The included rostral part of the brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement.

10 Years

COMPUTED TOMOGRAPHIC DIAGNOSIS

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

- Absent triadan 205
- Normal nasal cavity

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

HOSPITAL NAME The CT study of the skull presents without abnormalities, explaining the sneezing. Rhinoscopy including biopsy can be performed to screen for underlying non-specific rhinitis (e.g. allergic, lymphocytic plasmocytic, eosinophilic).
