

PATIENT PRESENTING CLINICAL SIGNS

Diesel Golden Bony growth below Right eye. Skin tag right side of face. Hx of Cushings for the past 2 years managed medically.
SPECIES Abnormal PE/Chem/CBC/UA Results: Fractured Left upper first premolar noted upon intubation. Recent thoracic and abdominal radiographs: normal thorax, small liver.

Canine COMPUTED TOMOGRAPHY OF THE SKULL

A high resolution pre- and post-contrast CT study of the skull is provided for review.

BREED COMPUTED TOMOGRAPHIC FINDINGS

Boston Terrier A supernumerary triadan 101 is noted. The tooth elements 306, 310, 311, 402, 408 and 411 are absent. Triadan 208 presents with an oblique fracture running through the mesial segment of the crown up into the mesial root; the palatine buccal root of triadan 208 is separated from the crown and the remaining roots present a moderate widening of the periodontal space.

SEX

Neutered Male At the lateral aspect of the right maxillary bone, distal to triadan 104, level with the right infraorbital foramen, a well-defined, solid mineralized mass is protruding from the maxillary bone into the subcutaneous tissue and the right infraorbital canal. The mineralizing mass is measuring approximately 1.7 x 1.1 x 1.5 cm in size. The mineralization mass is blending over into the 'normal' trabecular bone of the right maxilla.

AGE

10 Years, 4 Months The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining.

INTERPRETED BY

Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

HOSPITAL NAME

Mobile Pet Imaging

The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric. The pituitary gland is within normal limits for size and shape.

REFERRING VET

Meaux

The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

Nodular enlargement of the cranial pole of the left thyroid gland is appreciated, presenting a post contrast mild hypoattenuating nodular lesions, measuring 6.6 mm in diameter.

INVOICE

52467

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Monostotic benign osteoproliferative mass right maxillary bone
- Intraparenchymal nodular lesion left thyroid gland
- Complicated dental fracture 208 with accompanying periodontal disease
- Absent triadan 306, 310, 311, 402, 408 and 411
- Supernumerary triadan 101

DATE

6-15-22

PATIENT INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Diesel Golden The osteoproliferative mass presents without malignant imaging features and given the solid mineralizing mass the odds for osteoma are high. However, low grade chondroma, chondrosarcoma or osteosarcoma are potentials. Consider biopsy to rule out malignancy entirely.

SPECIES The intraparenchymal nodule of the left thyroid gland can be consistent with a thyroid cyst or indicate (non)functional nodular hyperplasia or neoplastic transformation of the parathyroid gland.
Canine Recommend complete blood work to screen for hypercalcemia.
