

PATIENT PRESENTING CLINICAL SIGNS

Spike Cinque History: Coughing/hacking/reverse sneezing.
Abnormal PE/Chem/CBC/UA Results: Elongated soft palate

SPECIES COMPUTED TOMOGRAPHIC STUDY OF THE SKULL

Canine A high resolution pre- and post-contrast CT study of the skull is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

BREED
Puggle Triadan 208 is absent.

In both nasal cavities, a mild to moderate amount of fluid attenuating material is attached to the nasal mucosal lining.

SEX
Neutered Male Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

AGE
11 Years Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

HOSPITAL NAME COMPUTED TOMOGRAPHIC DIAGNOSIS

Mobile Pet Imaging

- Rhinitis
- Absent triadan 208

REFERRING VET INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Dr. Meaux The computed tomographic findings are compatible with non-specific rhinitis, such as lymphocytic plasmocytic or eosinophilic ± bacterial superinfection. The changes noted are not typical of fungal rhinitis, a foreign body related rhinitis or evidence of oronasal fistula formation. There is no evidence of neoplastic disease.
