

PATIENT PRESENTING CLINICAL SIGNS

Lemon Conicella coughing for the past 10 days. Getting better, however will have ongoing episodes of coughing with excitement and some sneezing as well some ocular discharge

SPECIES RADIOGRAPHIC STUDY OF THE THORAX

Canine Radiographs of the thorax in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

BREED The surrounding bony structures are within normal limits.

Miniature Poodle The extrathoracic soft tissues present homogeneous without abnormalities.

SEX The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

FS

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

AGE

2 Years An increased visibility of the bronchial tree is noted.

INTERPRETED BY

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

HOSPITAL NAME

- Mild bronchial lung pattern

Balmy Beach Pet Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

REFERRING VET

Dr. Singh

The bronchial lung pattern is suggestive for bronchitis and primary inflammatory non-infectious causes – such as lymphocytic plasmocytic, eosinophilic, mixed – and infectious causes (e.g. viral, bacterial, parasitic) need to be considered. The acute onset of clinical signs would increase the odds for infectious origin, such as canine infectious respiratory disease complex (CIRD). Bronchoscopy including BAL can be used as advanced diagnostic tool if clinical signs persist.
