

PATIENT PRESENTING CLINICAL SIGNS

Mild Tsang Vomited hair, bile and undigested food this AM, diarrhea for 24 hours, anorexic.
 Abnormal PE/Chem/CBC/UA Results: T=103.8 F in the AM but dec to 101.5 at time of radiographs,
 5-8% dehydrated. CBC/Chem/T4 pending.

SPECIES RADIOGRAPHIC STUDY OF THE ABDOMEN

Feline Radiographs of the abdomen in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

BREED The surrounding bony structures are within normal limits.

DMH No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.
 The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

SEX The liver is appropriate in position, size and presents uniform opacity.

Female Spayed The splenic head is in the anticipated position and within normal limits for size and opacity.

AGE Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

1 Year, 10 Months The stomach is in its anticipated position and contains a moderate amount of fluid and foamy material.
INTERPRETED BY A small amount of granular mineralized material is appreciated in the pyloric antrum, consistent with Gravel-sign.

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

HOSPITAL NAME The colon is seen in the expected position, empty and collapsed but a small amount of gas.

Northvale Veterinary
 Clinic

RADIOGRAPHIC DIAGNOSIS

- Foamy material and fluid in stomach
- Empty colon

REFERRING VET INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Dr. Stefanie Simon The moderately distended stomach in combination with the Gravel sign is consistent with gastric emptying disorder, which can be functional or mechanical in origin. There is no evidence of radiopaque foreign material or abnormal gas pattern. At this point I would consider the odds for functional gastric emptying disorder higher than for mechanical obstruction – e.g. secondary to gastroenteritis. However, If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination are recommended.
