

**PATIENT PRESENTING CLINICAL SIGNS**

Stitch Ferragamo Evidence of increase adrenal activity. Recommend imaging to evaluate the size of the adrenal glands. Abnormal PE/Chem/CBC/UA Results: Normal physical exam, healthy rabbit. O reports increased aggression at home. P is neutered. Sent out adrenal panel - Evidence of increased adrenal activity

SPECIES COMPUTED TOMOGRAPHY OF THE ABDOMEN

Lagamorph A high resolution pre- and post-contrast CT study of the abdomen is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

BREED The serosal fat presents normal attenuation behavior. There is no evidence of peritoneal effusion or peritonitis.
Rabbit

Both kidneys present within normal limits for size, shape and organ architecture and are mildly hyperattenuating in the plain CT study. After contrast administration a bilaterally symmetric and uniform nephro- and pyelogram is noted. The urinary bladder is filled with contrast media due to preceding contrast administration.

SEX

Neutered Male The adrenal glands cannot be clearly demarcated against the filled intestinal tract and vascular structures with multiple streak artefacts – the region of the adrenal gland is unremarkable.

AGE

8 Years The liver presents with normal shape, even surface, uniformly attenuating parenchyma and homogeneous contrast enhancement, unremarkable.

The gastrointestinal tract contains a physiological amount of chymus.

INTERPRETED BY

A moderate subcutaneous swelling with multiple gas inclusions is appreciated along the abdominal wall bilaterally, R>L – due to preceding subcutaneous infusion.

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

Metal attenuating surgical clips are seen in the inguinal region bilaterally.

HOSPITAL NAME**COMPUTED TOMOGRAPHIC DIAGNOSIS**

- Normal abdomen

Mobile Pet Imaging
CFL

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**REFERRING VET**

The CT study of the abdomen presents without abnormalities. Unfortunately, the adrenal glands cannot be clearly demarcated as the chymus filled intestinal tract is pressing against the retroperitoneal space and multiple streak artefacts are emanating from the intestinal tract – the region of the adrenals appears normal.
