Rhodesian Ridgeback

RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the abdomen in two imaging planes are provided for review.

SEX RADIOGRAPHIC FINDINGS

SF

The intervertebral disc space T13/L1 is mildly narrowed.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

AGE

10 Years

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

INTERPRETED BY

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

HOSPITAL NAME

Reid Veterinary Hospital

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

REFERRING VET

Dr. Diane Heider

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Discopathy T13/L1
- Normal abdomen

INVOICE

52819

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the abdomen presents without abnormalities, but the discopathy T13/L1.

DATE

7-12-22

As the radiographic study is dated 7/7/22, follow up radiographs of the abdomen or an abdominal ultrasound examination might be beneficial if clinical signs deteriorate/are refractory to therapy.
