

**PATIENT**

Makenna Woodruff

PRESENTING CLINICAL SIGNS

vomiting and bloody diarrhea since last night
Abnormal PE/Chem/CBC/UA Results: mild abd. discomfort during palpation , blood work indicated dehydration CPLi Normal , OPG WNL X-ray sent to r/o FB

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the abdomen in three imaging planes are provided for review.

BREED

Bichon Frise Mix

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

Female Spayed

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

AGE

5 Years

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The stomach is in its anticipated position and contains a mild to moderate amount of gas and foamy soft tissue material.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas and granulated soft tissue material is seen within the small intestinal loops.

HOSPITAL NAME

St. Catherine's Animal
Hospital

The colon is seen in the expected position and is empty.

RADIOGRAPHIC DIAGNOSIS

- Mild alimentary pattern
- Empty colon

REFERRING VET

Dr. Masoud

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The material in the stomach and the small intestinal loops is most consistent with recent food intake, there are no signs for gastrointestinal mechanical obstruction. Given the acute onset of clinical signs, the presumptive diagnosis is gastroenteritis. If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination; in some cases, a high ileus may lack classical radiographic signs of mechanical obstruction.
