

PATIENT PRESENTING CLINICAL SIGNS

Rubble Buckler History: RFL lameness since jumping at the bottom of a hill in May, responded to Metacam Metacam last given on Wednesday, hasn't been lame since however owner still wanting to go ahead with CT

SPECIES

Canine

COMPUTED TOMOGRAPHIC STUDY OF THE FRONT LIMBS

A high resolution plain CT study of the front limbs is provided for review.

BREED

Old English Bulldog

COMPUTED TOMOGRAPHIC FINDINGS

Both shoulder joints present smooth osseous margins and the surrounding soft tissue structures are within normal limits.

SEX

Male

The periarticular bones of the left & right elbow joint present smooth osseous margins; the medial coronoid process of the elbow joints is well-defined and has a homogeneous density. A hypoattenuating streak is coursing through the base of the medial coronoid process of the left elbow joint– considered as an artefact. The elbow joints present mild incongruity of the joint space due to radio-ulnar step formation of 1.5 mm.

AGE

10 Months

The osseous and surrounding soft tissue structures of the antebrachium, carpus and front paw bilaterally are unremarkable.

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Mild incongruity of the elbow joints
- Normal shoulder joints
- Normal carpal joints

HOSPITAL NAME

Animal Trust- Bolton

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Both elbow joints present mild incongruent joint space due to radio-ulnar step formation, no additional abnormalities of the elbow joints are appreciated and the clinical relevance of the incongruity is unclear but can increase stress on the medial compartment of the elbow joint.
