
PATIENT PRESENTING CLINICAL SIGNS

Sage Miller 7/16/23- Patient presented for lethargy and bloody mucoid diarrhea. According to the owners, Sage has this problem every few months. Her rDVM has tested her for parvo and intestinal parasites numerous times and the tests were always negative per the owner. According to the owner, the rDVM suspects a liver shunt. US showed pancreatitis. Bloodwork showed low albumin likely from chronic pancreatitis but can't rule out ple.

SPECIES

COMPUTED TOMOGRAPHIC STUDY OF THE ABDOMEN
BREED

Yorkshire x

A high resolution pre- and post-contrast CT study of the abdomen is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

The serosal fat presents normal attenuation behavior. There is no evidence of peritoneal effusion or peritonitis.

SEX

Spayed Female

Both kidneys present within normal limits for size, shape and organ architecture. After contrast administration a bilaterally symmetric and uniform nephro- and pyelogram is noted.

AGE

11 Months

The adrenal glands are within normal limits for size, shape and organ architecture.

Both liver and spleen present with normal shape, even surface, uniformly attenuating parenchyma and homogeneous contrast enhancement, unremarkable.

INTERPRETED BY

 Sebastian Schaub,
 DVM Dr. med. vet.
 DipECVDI

The portal vein presents a normal order of its tributary veins and intrahepatic branching. No abnormal vessel is noted inside and outside of the liver parenchyma.

The pancreas is evenly contoured, the pancreatic parenchyma is homogeneous and presents uniform contrast enhancement.

HOSPITAL NAME

Neel Vet Hospital

The position, delineation, wall and content of the gastrointestinal tract are considered within normal limits throughout.

The bony and surrounding soft tissue structures reveal no abnormalities.

COMPUTED TOMOGRAPHIC DIAGNOSIS
REFERRING VET

Dr. Deepan Kishore

- No evidence of portosystemic shunting, neither intra- nor extrahepatic

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS
INVOICE

44363

No macroscopic vascular bypass of the liver was noted in the pre- and post-contrast studies of the abdomen. However, if the clinical signs are consistent with insufficiency of the liver primary non-cirrhotic portal hypertension (microvascular dysplasia) or other diffuse parenchymal liver disease would still be a potential and should be ruled out by means of ultrasound guided or surgical liver biopsy.
