

PATIENT PRESENTING CLINICAL SIGNS

Ollie Hart per owner hopping and walking like bunny no hx of trauma
Abnormal PE/Chem/CBC/UA Results: no pain on palpating both pelvic limb, no joint effusion or crepitus

SPECIES RADIOGRAPHIC STUDY OF THE STIFLE JOINTS

Canine Radiographs of the stifle joints in two orthogonal imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

BREED
English Springer Spaniel
Both coxofemoral joints present flattened femoral heads and moderate osteophyte new bone formation of the periarticular bones. The coxofemoral joint space is widened, L>>R. The acetabular groove bilaterally is shallow and the center of the femoral heads is lateral to the dorsal acetabular rim.

The growth plates are age related visible - accentuated the apophysis of the tibial tuberosity bilaterally. Both stifle joints present smooth osseous margins of the periarticular bones and without signs of intracapsular soft tissue swelling. The patella of both stifle joints is in situ.

SEX

MN

RADIOGRAPHIC DIAGNOSIS

- Degenerative osteoarthritis coxofemoral joints bilaterally due to marked hip dysplasia
- Normal stifle joints

AGE

10 Months

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INTERPRETED BY

The marked hip dysplasia can be a source for the described abnormal gait, if clinical examination is supporting the diagnosis - recommend discussing the chances of surgical management (e.g. TEP) with orthopedic surgeon.

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The appreciated radiolucent zone at the distal aspect of the tibial tuberosity is consistent with an open apophysis and can be considered as a normal finding.
