Elvis Klemcke

PRESENTING CLINICAL SIGNS

Mass located on left hind limb.

SPECIES

Canine

COMPUTED TOMOGRAPHY OF THE HIND LIMBS

A high resolution pre- and post-contrast CT study of the hind limbs are provided for review.

BREED

Beagle

COMPUTED TOMOGRAPHIC FINDINGS

At the caudodistal aspect of the left thigh, in the fascial plane between the semitendinosus & semimembranosus muscle, a well-defined, uniform fat attenuating, ovoid shaped mass is appreciated, measuring 10.5 x 7.5 x 6.1 cm in size. The fat attenuating mass is extending from the level of the proximal third of the left femoral diaphysis distally up into the subcutaneous tissue at the caudal aspect of the left gastrocnemius muscle. The sciatic nerve is displaced laterally and cranially by the mass effect and in close contact with the mass.

SEX

MN

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Intermuscular lipoma caudal aspect left thigh

AGE

14

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT study is consistent with an intermuscular lipoma at the caudodistal aspect of the left thigh, there is no evidence of invasive growth and complete surgical excision of the mass appears feasible. Be aware of the sciatic nerve coursing along the craniolateral aspect of the mass.
