

PATIENT PRESENTING CLINICAL SIGNS

Josie Jennings She has been fine acting fine and pooping fine. Then she started to vomit. When she vomited one time it looked like there was hair in the vomit once. The more she started to vomit it was white bile.
Abnormal PE/Chem/CBC/UA Results: PE: SLIGHT DEHYDRATION NO BLOOD WORK DONE

SPECIES RADIOGRAPHIC STUDY OF THE ABDOMEN

Canine Radiographs of the abdomen in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

BREED The surrounding bony structures are within normal limits, the growth plates are age related open.

Labrador Retriever No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.
The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

SEX The liver is appropriate in position, size and presents uniform opacity.

Female The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

AGE Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.
10 Weeks

INTERPRETED BY The stomach is in its anticipated position and presents normal content.

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

HOSPITAL NAME RADIOGRAPHIC DIAGNOSIS

Elizabeth Animal Hospital

- Normal abdomen

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

REFERRING VET The radiographic study presents without abnormalities, explaining the vomiting. There is no evidence of radiopaque foreign material, abnormal gas pattern or signs for gastrointestinal mechanical obstruction. If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination; in some cases a high ileus may lack classical radiographic signs of mechanical obstruction.
