

PATIENT PRESENTING CLINICAL SIGNS

Lizzie Weinberger Abdominal neoplasia, primary spleen - high suspicion for lymphoma Secondary non-regenerative anemia, lymphocytosis, & mild abdominal effusion (suspect hemoabdomen)
 Vomiting/diarrhea/nausea/hyporexia + elevated pancreatic enzymes. 3 VIEW CHEST Rads - met check
SPECIES Abnormal PE/Chem/CBC/UA Results: Moderate, non-regenerative anemia; lymphocytosis; elevated lipase & amylase HCT 28.4%, MCV 53.8, WBC 20K, Lymphs 8.49K Amylase 1887, Lipase 2920
 Canine All else WNL

RADIOGRAPHIC STUDY OF THE THORAX

BREED Radiographs of the thorax in three imaging planes are provided for review.

Golden Ret. **RADIOGRAPHIC FINDINGS**

The surrounding bony structures are within normal limits.

SEX The extrathoracic soft tissues present homogeneous without abnormalities.

FS The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

AGE Dorsal to the second and third sternebra, a fusiform increased soft tissue volume is appreciated.

10 Years The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

Sebastian Schaub, DVM The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.
 Dr. med. vet. DipECVDI

HOSPITAL NAME The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

Long Valley Animal Hospital

RADIOGRAPHIC DIAGNOSIS

- Suspect lymphadenopathy sternal lymph nodes
- No evidence of pulmonary metastatic disease
- History of peritoneal effusion due to splenic mass

REFERRING VET

Dr. Lauren Semanchik

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INVOICE The appreciated soft tissue opacity dorsal to the cranial segment of the sternum is suggestive for lymphadenopathy of the sternal lymph nodes – can present reactive hyperplasia or metastasis as the sternal lymph nodes drain parts of the cranial abdomen.
