

PATIENT PRESENTING CLINICAL SIGNS

PATIENT Andy Bechtel **PRESENTING CLINICAL SIGNS** History: was vomiting 2 times a day for 4 days- undigested food (during the last week, hasn't thrown up since Sunday) has history of urinary tract infection + urine crystals

SPECIES Abnormal PE/Chem/CBC/UA Results: Uncomfortable/in pain on abdominal palpation, Inflamed penis noted while collecting urine sample via urinary catheter BW- WNL except elevated cholesterol
Feline

RADIOGRAPHIC STUDY OF THE ABDOMEN

BREED A right & left lateral view of the abdomen is provided for review.

DSH RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

Neutered Male No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.
 The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

AGE

8 Years The liver is appropriate in position, size and presents uniform opacity.
 The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

INTERPRETED BY

Sebastian Schaub,
 DVM Dr. med. vet.
 DipECVDI

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. An innumerable amount of mild mineral opaque calculi are superimposed on the urinary bladder and the region of the ventral urinary bladder wall.

The stomach is in its anticipated position and presents normal content.

HOSPITAL NAME

St. Catharines AH

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

REFERRING VET

Dr. Jui Gokhale

The colon is seen in the expected position and is nearly empty but a small amount of gas and fecal material

RADIOGRAPHIC DIAGNOSIS

INVOICE

- Cystolithiasis
- Empty gastrointestinal tract

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

DATE

7/8/22

The main finding are the urinary calculi in the urinary bladder - some are associated with the region of the ventral urinary bladder wall, suggestive that the calculi are adhering to the wall due to chronic

PATIENT inflammation. Recommend complete urinalysis for further workup. Dysuria might be a source for abdominal pain and vomiting.

Andy Bechtel

There is no evidence of radiopaque foreign material or signs for gastrointestinal mechanical obstruction.
